

LSASD Project ID: 20-0018

Sample and Analysis Plan

Characterization of Ambient PFAS in the Chattooga River Watershed

*Project Location: Chattooga River Watershed
(Georgia and Alabama)*

Project Date(s): November 4th – 8th, 2019

Final SAP Approval Date: October 25, 2019

Project Leader: Greg White
Environmental Sampling Section
Applied Science Branch
Laboratory Services & Applied Science Division
USEPA – Region 4
980 College Station Road
Athens, Georgia 30605-2720

The activities depicted in this Sampling and Analysis Plan (SAP) are accredited under the US EPA Region 4 Laboratory Services & Applied Science Division ISO/IEC 17025 accreditation issued by the ANSI-ASQ National Accreditation Board. Refer to certificate and scope of accreditation AT-1644.

Team Members ^{1,2}	Organization	Responsibilities
Greg White	EPA/R4/LSASD	Project Leader
Nate Barlet	EPA/R4/LSASD	Safety Officer/Sampler
Jerry Ackerman	EPA/R4/LSASD	Discharge Task Lead/Sampler
Mel Parsons	EPA/R4/LSASD	Sampler
John Ruiz	EPA/R4/LSASD	Sampler
Bill Simpson	EPA/R4/LSASD	Sampler

¹ Project team members subject to change due to scheduling conflicts.

² Project Leader and all Task Leaders assisting with this project have been deemed competent by LSASD management, under ISO 17025 accreditation, to conduct the tasks required to fulfill the prescribed goals.

A3. Site Description and Background Information

The headwaters of the Chattooga River begin in Walker County north of LaFayette Georgia. The Chattooga River flows south across the Alabama-Georgia state line and feeds into Weiss Lake near Gaylesville Alabama. Per- and polyfluoroalkyl substances (PFAS), specifically perfluorooctanesulfonate (PFOS), were detected in the surface water at several sites along the Chattooga River during a 2018 study performed by U.S. EPA Region 4's Laboratory Services & Applied Science Division (LSASD) (USEPA, 2018). PFAS have also historically been detected downstream at public drinking water intakes in Centre Alabama and Gadsden Alabama (USEPA, 2019b).

PFAS are man-made chemicals that do not occur in nature and have been found to be persistent and accumulate in both the environment and the human body via exposure pathways such as consumption of contaminated food and drinking water. PFAS have been extensively used in industry, manufacturing of commercial products, and most notoriously as a component in aqueous film forming foams (AFFF) used for firefighting. There is evidence that suggests exposure to PFAS can lead to adverse health effects and are an emerging concern to public health. PFAS is a generic nomenclature encompassing a broader array of chemicals, with the most studied being perfluorooctanoic acid (PFOA) and perfluorooctanesulfonate (PFOS). The U.S. EPA has issued a Recommended Health Advisory for drinking water of 70 ng/L (ppt) for combined concentrations of PFOA and PFOS compounds. Extensive information regarding PFASs can be found at <http://www.epa.gov/pfas>.

A4. Problem Definition

The 2018 Phase 1 Study by LSASD observed positive detections of PFOS in surface water in the upper Chattooga River Watershed. PFOA was not detected in the 2018 study conducted by LSASD. The 2018 sampling of the Chattooga River by LSASD was conducted during an extreme high flow event thus dilution effects may have been a factor (USEPA, 2018). Major findings of the 2019 Phase 2 Study by LSASD with respect to the Chattooga River include: 1) the highest total PFAS concentrations of all streams sampled; 2) the highest diversity of distinct PFAS compounds detected; 3) a contribution of about 25% of total PFAS loading to Weiss Lake at a flowrate 7 times lower than the Coosa River during the study period (USEPA, 2019b). As guided by findings of the 2018 Chattooga River Study (Phase 1), the 2019 Weiss Lake Study (Phase 2), and directives of the R4 Water Division, this study will target near-base flow conditions as background concentrations of PFAS for the Chattooga River Watershed are largely unknown.

This study will observe background concentrations of PFAS in surface water and co-located sediment samples to characterize the relative distribution of PFAS in the Chattooga River Watershed along key segments determined by the Water Division. Ambient surface water concentrations of PFASs will be coupled with flow measurements to calculate instantaneous mass loading rates at near-base flow conditions. Sampling locations bracket off the following key segments of the Chattooga River based on the following municipalities in Georgia: Lyerly, Summerville, Trion, and LaFayette.

A5. Project Description, Goals, and Study Boundaries

Study Goal:

Characterize the distribution and instantaneous mass loading of PFAS in the Chattooga River Watershed at near-base flow conditions along key segments determined by the R4 Water Division.

Study Objectives:

1. Collect surface water samples coupled with discharge measurements to compute instantaneous mass loading rates of PFAS along key segments of the Chattooga River Watershed.
2. Collect sediment samples collocated with surface water sample locations to determine the relative distribution and the potential for migration of PFAS contaminated sediments to the receiving waters of Weiss Lake.

Study Area:

The study area for this project includes the main stem of the Chattooga River and several inflowing tributaries. Proposed sampling locations range from the lower Chattooga River near Gaylesville Alabama where the river terminates into Weiss Lake, to the headwaters of the Chattooga River north of LaFayette Georgia (Appendix A: Site Maps). A total of 13 sites will be assessed which includes 8 stations on the main stem of the Chattooga River, 1 station on Town Creek which forms the headwaters of the Chattooga River, 3 tributary stations in watersheds with active biosolids application sites, and 1 station on Mill Creek, a significant tributary in Alabama. See Table 1 for a description of all sampling sites.

Study Design/Approach:

Standard Operating Procedures for all sampling and field measurement activities outlined in this study plan are referenced in Section B5: Sampling and Measurement Procedures.

In-Situ Water Quality

Surface water quality measurements of temperature, dissolved oxygen, specific conductance, turbidity, and pH will be collected *in-situ* via multi-parameter data sondes at each site. See Table 2 for a detailed list of *in-situ* water quality parameters and measurement uncertainties. All multi-parameter data sondes will be maintained and calibrated in accordance with LSASD Standard Operating Procedure for Equipment Inventory and Management (SESDPROC-1009-R0) and those selected in Section B.5. All equipment calibrations will be verified in accordance with LSASD Calibration and End-Check Acceptance Criteria (SESDFORM-060-R0).

PFAS Loading Rates (Surface Water Sampling and Discharge Measurements)

Surface water samples will be collected at each site and transported to the EPA R4 Laboratory at LSASD in Athens Georgia to be analyzed for the 23 PFAS analytes listed in Table 4. PFAS sample collection, preservation, and holding times are listed in Table 3. Surface water sample collection methods will vary based on site conditions (e.g. direct fill method where possible or grab method via stainless-steel bucket or

scoop). A corresponding discharge will be either directly measured via handheld or remotely-operated flowmeters or retrieved from USGS gaging stations for each sampling location to compute an instantaneous mass loading rate of detected PFAS compounds. This study will target near-base flow conditions. Approximate base flow conditions will be defined as a discharge below the monthly mean for November as recorded by historical streamflow data collected at the USGS gage located on the lower Chattooga River (USGS 02398300) over a 30-year period. The threshold value is 450 ft³/s. A discharge above this threshold will be considered non-base flow conditions and the sampling event will be postponed until water levels recede to appropriate levels. Best professional judgement will be used in consultation with the R4 Water Division to determine how to proceed if these environmental conditions are not met.

Sediment Sampling

Sediment samples will be collected at each site and transported to the EPA R4 Laboratory at LSASD in Athens Georgia to be analyzed for the 23 PFAS analytes listed in Table 4. PFAS sample collection, preservation, and holding times are listed in Table 3. Sediment sample collection methods will vary based on site conditions (e.g. grab method via stainless-steel scoop where possible or an alternate grab method via stainless-steel petite Ponar). Each sediment sample will consist of a composite of 3 sediment aliquots collected across a transect perpendicular to the stream flow to account for streambed heterogeneity.

Quality Control Samples

Multiple control samples will be collected in accordance with LSASD Standard Operating Procedures and accepted trace-level contaminant sampling practices. Control samples will include trip blanks, field blanks, field equipment rinse blanks, field duplicate samples, and matrix spike/matrix spike duplicate (MS/MSD) field samples. Surface water and sediment samples collected for PFAS analysis will be sampled via a trace level sampling technique to avoid cross-contamination of PFAS samples due to sample collection and handling. This process will require two field personnel for PFAS sample collection. A designated sampler will handle the sample media and sample container only. A second designee will operate sampling equipment and assist with sample container packaging and labeling. An outline of all quality control samples is listed in Section B3: Quality Control.

Project Timeline:

All field activities for this study are planned for the week of November 4th, 2019. Laboratory turn-around time is 35 days from the time samples are received. The draft final report for this study is expected to be provided to the Water Division on January 22th, 2020.

A6. Applicable Regulatory Information

The U.S. EPA has established a life-time exposure recommended health advisory level for drinking water of 70 parts per trillion for PFOA and PFOS individually or combined. There are currently no Maximum Contaminant Levels (MCLs) or enforceable standards for PFOA, PFOS, or other PFAS related compounds in any media (e.g. drinking water, surface water, soils and sediments) set by the U.S. EPA or the states of Georgia and Alabama.

A7. Decision(s) to be made based on data

This study will provide relative mass loadings of PFAS compounds in surface water along key segments of the Chattooga River Watershed and insight into the relative distribution and the potential for migration of PFAS compounds in sediments to the receiving waters of Weiss Lake; as well as provide a comparison of PFAS concentrations and compositions in sediment and surface water along the Chattooga River Watershed. All further decisions, recommendations, and/or actions will be made at the discretion of the U.S. EPA's R4 Water Division.

SECTION B: Data Generation, Acquisition, and Reporting

Will samples or physical evidence be collected:	<input checked="" type="checkbox"/> Yes – <i>If yes, complete all subsections in Section B.</i> <input type="checkbox"/> No – <i>If no, no action needed for B1, B2, B3 or B4, proceed to B5.</i>
---	--

B1. Sampling Design/Information Inputs

Sample Media	Total Number of Samples	Analyses
Surface Water	13 samples + duplicate + 4 QC + MS/MSD	PFAS (See Tables 3 & 4)
Sediment	13 samples + duplicate + MS/MSD	PFAS (See Tables 3 & 4)

B2. Sampling Handling and Custody

As outlined in the *Applied Science Branch Quality Assurance Project Plan* (USEPA, 2019a), all samples will be handled and custody maintained in accordance with the LSASD Laboratory Services Branch Laboratory Operations and Quality Assurance Manual, LSASD Operating Procedure for Sample and Evidence Management, SESDPROC-005, and LSASD Operating Procedure for Packing, Labeling and Shipping of Environmental and Waste Samples, SESDPROC-209.

Will a Chain-of-Custody be produced?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No
--------------------------------------	--

During the duration of the event, have preparations been made to ensure that custody is maintained?

Custody of a sample or physical evidence is defined as:

- *It is in the actual possession of an investigator*
- *It is in the view of an investigator, after being in their physical possession*
- *It was in the physical possession of an investigator and then they secured it to prevent tampering*
- *It is placed in a designated secure area*

☒ **Yes**
☐ **No**

B3. Quality Control

Field quality control measures will be performed in accordance with the LSASD Operating Procedure for Field Sampling Quality Control, SEDSPROC-011.

Field quality control (QC) samples include the following:

- Each batch of samples will contain a duplicate quality control sample for each analysis. The duplicate samples will be collected at CHR01.
- Each batch of surface water and sediment samples being analyzed for PFAS will also contain an additional sample volume for matrix spike/matrix spike duplicates (MS/MSD). MS/MSD volumes will be collected at TOC01 at the headwaters of the Chattooga River to characterize background PFAS concentrations in surface water and sediment.
- Temperature blanks will be placed in all sample coolers.

The following additional quality control (QC) samples will be collected and analyzed for PFAS contamination:

- A field blank will be collected by the sampling team at the onset and completion of field activities.
- Trip blank(s) will be stored and transported with collected samples through the duration of the study.
- If a field equipment decon is needed, a separate field equipment rinse blank will be collected for PFAS sediment sampling equipment (e.g. stainless-steel petite Ponar sediment grabs, spoons, scoops, and bowls), and PFAS surface water sampling equipment (e.g. buckets and/or scoops).
- All blank quality control (QC) samples will be prepared utilizing PFAS-free water supplied by the U.S. EPA LSASD laboratory in Athens, GA.

PFAS sampling protocol:

- A two-person trace-level sampling protocol will be used for all PFAS sample collection. One member of the sampling team will handle the sample media and sample container only. A second team member will be designated to handle sampling equipment and assist with sample packaging and labeling.
- All sampling equipment will be cleaned using Luminox® and warm tap-water, then rinsed in PFAS-free water before being air-dried and sealed in clean plastic sheets in preparation for field activities.
- Sampling equipment known to contain PFAS will be avoided during sampling activities.

Laboratory quality control measures are specified in the *LSASD Laboratory Services Branch Laboratory Operations and Quality Assurance Manual* (USEPA, 2019c).

B4. Analytical Methods and Support

Samples will be analyzed by the EPA/LSASD laboratory in Athens, GA in accordance with the LSASD Laboratory Services Laboratory Operations and Quality Assurance Manual (USEPA, 2019c). Specific analytical methods are listed in Table 4.

Samples submitted to a Contract Laboratory Program (CLP) laboratory will be analyzed in accordance to the current statement of work.

Laboratory Turn-Around-Time Requested: 35 Days

Reporting Levels:

- ☒ Non-Routine Reporting Levels **ARE NOT** Required, No Further Action.
- ☐ Non-Routine Reporting Levels **ARE** Required, List Below.

Non-Routine
Reporting Levels:

n/a

Waste Samples Anticipated:

- ☐ Yes
- ☒ No
- ☐ Unknown

If answer is yes, specify laboratory to receive samples: *n/a*

B5. Sampling and Measurement Procedures

Sampling and measurement activities will be in accordance with the LSASD operating procedures. The following field procedures will be followed during this study, check all that apply. The most recent version of LSASD operating procedures can be found at <https://www.epa.gov/quality/quality-system-and-technical-procedures-sesd-field-branches> (Last Update: 4/05/18)

Section C: Reporting

C1. Reporting

Estimated Report Completion Date: 01/22/2020

Is a Provisional Data Release Anticipated?

☒ Yes

☐ No

Provisional data refers to final analytical and field measurement results that may be subject to further interpretation and/or data assessment by the project leader prior to the issuance of a final field investigation report. Provisional data may be provided prior to the completion of the LSASD final report only if LSASD management approves the release of the information and the analytical data have been released as final from the LSASD Laboratory Services Branch, for LSASD generated data, and/or the LSASD Quality Assurance Section, for non-LSASD generated data. Release of provisional data will be transmitted by electronic or hard copy with official correspondence from the Section Chief in accordance with the LSASD Operating Procedure for Report Preparation and Distribution (SESDPROC-003).

Additional Comments: Provisional data may be released to EPA R4 Water Division pending issuance of final report for the purpose of planning regional priorities related to PFAS.

Site-Specific Hazards ID/Risks Determination/Controls Assignment:

List hazards that may be encountered *ONLY* for this work activity (use information from the hazards identification checklist reference included in the Work Control Planning Document)

Hazards	Quantity, Length and/or Likelihood of Exposure	Severity of Exposure or Potential Injury/Illness	Assign Controls	Relative Risk with Controls
Working in extreme temperature conditions	moderate	first aid	ppe / engineering / training	moderate
Remote locations	moderate	minimal	engineering	low
Poisonous insects, plants; dangerous animals	moderate	first aid	ppe / training/ engineering	moderate
Slip/trip/falls – traversing mountainous or other undeveloped terrain or aquatic systems	moderate	first aid	ppe / engineering	moderate
Driving/travel	moderate	first aid	administration / training	moderate
Boating Operations	moderate	serious	ppe / training/ engineering	moderate
Trailerling	moderate	serious	ppe / training/ engineering	moderate

Overall Site and Work Activities Relative Risk Level: (Based on the hazard/risk determinations above and in the general Work Control Planning Document)

Very Low <input type="checkbox"/>	Low <input type="checkbox"/>	Moderate <input checked="" type="checkbox"/>	High <input type="checkbox"/>	Very High <input type="checkbox"/>
--------------------------------------	---------------------------------	---	----------------------------------	---------------------------------------

Recommended General Level(s) of PPE:

Level of Protection: (check those that apply)	Level A <input type="checkbox"/>	Level B <input type="checkbox"/>	Level C <input type="checkbox"/>	Level D <input checked="" type="checkbox"/>
--	-------------------------------------	-------------------------------------	-------------------------------------	--

Modifications:

Respiratory:	
Field Dress:	Sun glasses, hat, boots, waders
Other:	

SIGNATURE SHEET

**I have read and understand the FSP, and the associated operational controls. I affirm that I will work safely and according to the established controls.*

Print Name	Signature	Date
